

EOS

# Powered by the INTEREL OS and connected with WiFi, 2xBLE, and Zigbee\*

reddot winner 2021

EOS is the most integrated IoT thermostat for smart buildings.

## Fusion sensor

Combining data from 6 sensors for presence and activity sensing

## Global fit

Built to fit the diverse requirements of global HVAC applications and MEP standards

## INTEREL

### OS

Track record of improving hardware OTA software updates over the course of a decade

## Built for

### scale

Using technology to reduce total cost of ownership and achieve scale in the select service tier

Partners in success

\*for all standard and non-standard protocols.

Retrofit New build

**GRMS**

Guest Room Management System for Luxury hospitality

- Highly customizable
- Full featured room controls
- Advanced lighting controls

**EOS**

Enterprise-grade WiFi thermostat, IoT hub and environmental fusion sensor

- Single component solution
- Integrated sensors and I/O reduce total hardware and project costs
- Cloud connected & OTA updates
- Mobile app enabled deployment
- Virtualized hardware
- INTEREL app store for IaaS and SaaS applications
- Built-in multi-radio/standard IoT infrastructure
- Fusion sensing for presence and activity sensing

# Built-in IoT infrastructure

connect  smart<sup>®</sup>

***INTEREL***

**Built-in  
by default**

## **Infrastructure as a Service (IaaS)**

Making an entire building IoT-ready requires a digital infrastructure that allows smart devices to communicate wirelessly with each other.

With connectBsmart, hotels do not need to install a dedicated BLE infrastructure. INTEREL devices with connectBsmart technology can not only communicate with, but also bring online, other devices over Bluetooth and ZigBee.

Since connectBsmart is a technology that is built into powered, online devices, it overcomes all traditional limitations of BLE beacons.

# Proven use case: Networking of guest room door locks

**INTEREL**

Delivered in thousands of rooms with the leading door lock vendors

## Traditional door lock network

Cost for Passive items  
1 Cable & conduit

Cost for Active items  
2 Switches  
3 Routers (maximum 4 locks per access point)

Cost of Installation & ongoing maintenance

## Built in IoT infrastructure for IaaS and SaaS applications

- No single point of failure
- Advanced real time event exchange
- No additional wiring for door lock system
- Eliminate ZigBee mesh networks
- Most cost effective way to network door locks

# Apps for service delivery optimization

**INTEREL**

Extending guest convenience and staff workflow efficiency to select service properties.

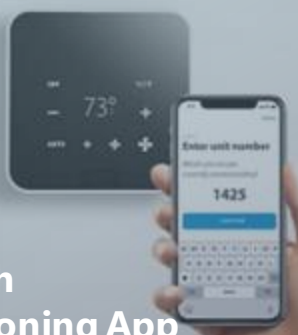

## Room Services & Express checkout

- Hardware features built in, but dormant at launch
- Activated by OTA update
- Leveraging existing partnerships and proven integrations to market leading service optimization solutions
- EOS extends UI to become the guest service panel
- Guestroom status is communicated to all hotel systems, along with guest presence in room

Utilities are  
2<sup>nd</sup> highest  
cost in  
hotel, Staff  
are the  
**highest** cost

Hardware platforms

## Energy Management

We built a very powerful state machine into INTEREL OS. This state machine allows our energy management to be adjusted to the specific requirements of your property, while still benefiting from our vast experience in energy management.

## Lighting Control

Whether your property has simple on-off lighting or the most complex lighting scenes designed by a lighting consultant, INTEREL OS can control it. Plenty of options for dimming including technologies like DALI and DMX satisfy even the most challenging requirements.

## Cloud updates

In our latest release we have now included over-the-air update functionality in INTEREL OS. This opens up a world of feature growth not only to INTEREL OS but to all our submodules and radios. A monumental step for INTEREL OS and the future capabilities of our hardware.

## Process automation

By pairing our proprietary automation tools and paired with INTEREL OS it became a very fast and powerful tool for our logic programmers to meet our customer's requirements without having to go back to R&D for firmware development.

# INTEREL<sup>OS</sup>

with open APIs

## Smart Building Infrastructure

What you see are sleek, minimalistic switches and thermostats. But it's what's hidden inside that's even more beautiful: INTEREL's award-winning connectBsmart IoT infrastructure can connect the countless devices your property has today, and more importantly, the ones of tomorrow.

## Smart Lock Interfaces

While they all open doors, every smart lock supports a distinct set of features that makes them different to their competitors. We support the varying and nuanced requirements of each brand resulting in powerful integrations.

## Hardware, Software, Services

We engineer our hardware and software to work together seamlessly. This allows INTEREL OS to utilize the physical resources of our products to the fullest extent and it allows us to constantly deliver more value to our customers on the same hardware.

## HVAC Expertise

HVAC is at the core of what we do. This is why we built a very powerful HVAC engine into INTEREL OS, that can deal with the many HVAC environments we find across the world.

end2end  
process

# A data collection process that results in less complexity for the field technician

**INTEREL**

Collect data about the HVAC system in the online quotation (1) and post purchase (2) forms.

Upload correct firmware and configuration settings for EOS to online file repository.

Field technician can commission EOS by simply entering the unit number, "one touch".

# The commissioning process packaged into a simple app

The **unit number** acts as the only identifier in the INTEREL cloud to access and upload the correct files and settings to EOS.

**All the field technician needs to know is the unit number for successful commissioning.**

 Drastically reduce commissioning errors on site.

 Doesn't depend on skill level of field technicians.

INTEREL cloud

# An app as the commissioning tool

The field technician connects to EOS through his/her phone.  
EOS goes online through the phone.

No extra hardware required

No separate infrastructure required
